Instructions for **BOTTLE: TENTH CHECK**

The Tenth Check

enables quick and easy measurement of bottle contents by dividing the bottle into tenths, required in normal stocktaking practice, and this from bottle to bottle provides a consistent stock position.

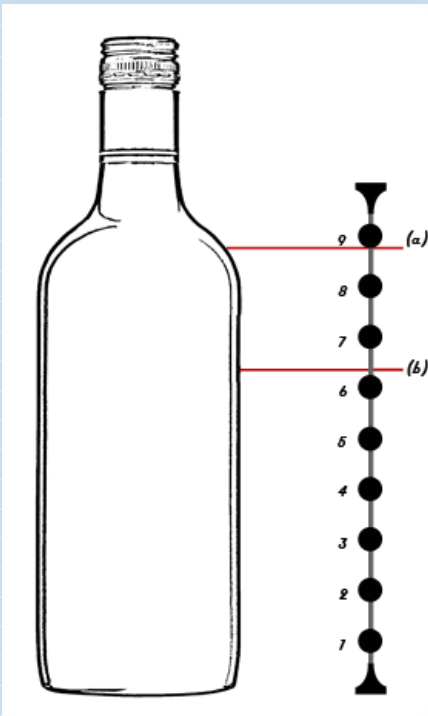

- Use the Silver Tenth Check for bottles 70cl to 1.5 litres
- Use the Gold Tenth Check for bottles 1.5 litres to 4.5 litres

Method of Use

- Hold the Tenth Check as shown in the diagram.
From the base of the bottle to approximately level with the bottle neck.
- Then check the level of the liquid against the Tenth Check using the marker nearest.

Example:

- (a) - the level would read as nine tenths
- (b) - the level would read as six tenths

Note:

The Tenth Check makes allowances for the different thickness of the bottle at the base and at the neck and adequately accommodates for odd shaped bottles thus providing a consistent stock analysis on bottles of the same shape and size.
